

Installation Guide

JD 3010-4020 Compact Tractor KM 129 Seat Kit (PN: 6949)

KM 129
PN: 7103

1. Remove old seat off of tip forward base plate. Remove old operator presence switch and harness to re-use in new seat.
2. Place drilling template onto JD plate that tips forward and line up two existing holes with the two outside holes in the template (indent on template edge should face the rear of JD plate). Mark original JD plate using two inside smaller holes on template with a center punch or marker for drilling.
3. Use 3/8" drill bit to drill two holes marked in step 2. (drilling template can then be discarded).
4. Install new seat onto JD tip forward plate using two existing holes and two new holes drilled in step 3 with the four 5/16" bolts provided.
5. Install old twist in operator presence switch from old seat into new seat and run wiring harness out the bottom of the base through hole and plug back in to tractor. (If old one doesn't fit may need new "twist in" operator presence switch.)
